

Install AB Belleza Integral in your own Salesforce org

A step-by-step guide to putting this salon management app in a free Salesforce Trailhead Playground or Developer Edition org, from scratch. You don't need any Salesforce development experience.

~20 minutes

start to finish

Free

every tool used here costs nothing

Mac or Windows

the commands are the same

What you'll have at the end: the app's dashboard running in your org (shown with fictional sample data).

How it works

The app is a set of files on GitHub. You download them to your computer, then a free tool called the **Salesforce CLI** sends them to your Salesforce org. That's it: no coding and no clicking through Setup.

Use a practice org, not a real business org

Install this in a Playground or Developer Edition org. The app adds its own objects, pages and automation, and the optional sample data is meant for empty orgs only.

The app is in Spanish

It was built for a salon in Argentina, so the screens, buttons and messages are in Spanish and amounts are in Argentine pesos. This guide is in English.

The steps at a glance

#	STEP	WHAT YOU DO
1	Install the Salesforce CLI	Download and run an installer
2	Download the app	Download a ZIP file from GitHub and unzip it
3	Open a terminal in the app's folder	One small trick, shown for Mac and Windows
4	Connect your org	Log in once through your browser
5	Deploy the app	One command
6	Give yourself access	One command
7	Load sample data OPTIONAL	One command
8	Open the app	One command, then the App Launcher

1 Install the Salesforce CLI

The Salesforce CLI is the free, official tool that sends the app to your org.

1. Go to developer.salesforce.com/tools/salesforcecli.
2. Under **Choose your operating system**, click the download for your computer.
3. Open the downloaded file and follow the installer, accepting the defaults.

Choose your operating system

macos

[Download for macOS \(Apple Silicon\)](#)

[Download for macOS \(Intel CPU\)](#)

Windows

[Download for Windows x64](#)

[Download for Windows ARM64](#)

Linux

[Download for Linux x64](#)

Which Mac download?

Click the Apple menu → **About This Mac**. If it says **Apple M1, M2, M3...**, choose *Apple Silicon*. If it says **Intel**, choose *Intel CPU*.

Check that it worked

Open a terminal: on Mac, open the **Terminal** app (search for it with ⌘ + Space). On Windows, open **PowerShell** from the Start menu. Then type this and press **Enter**:

TYPE `sf --version`

You should see a version number, similar to this:

```
$ sf --version
@salesforce/cli/2.150.6 darwin-x64 node-v24.15.0
```

Your numbers will be different, and that's fine. If you see *command not found*, close the terminal, open a new one and try again.

2 Download the app

1. Go to github.com/francoansaldi7/salesforce-ab-belleza-integral.
2. Click the green **Code** button.

3. In the menu that opens, click **Download ZIP**.
4. Unzip the file:
 - **Mac:** double-click it in Downloads. Safari often unzips it for you.
 - **Windows:** right-click it → **Extract All...** → **Extract**.

You now have a folder called `salesforce-ab-belleza-integral-main`.

Simplified sketch of the menu

How to know you have the right folder

Open it. You should see a folder named `force-app` and a file named `sfdx-project.json`. On Windows, the unzipped folder sometimes contains *another* folder with the same name. If so, go inside it until you see `force-app`.

Know Git? You can run `git clone https://github.com/francoansaldi7/salesforce-ab-belleza-integral.git` instead.

3 Open a terminal in the app's folder

The commands in the next steps must run **inside** the app's folder (the one with `force-app` in it).

On Mac

1. Open **Terminal**.
2. Type `cd` followed by a **space**. Don't press Enter yet.
3. Drag the folder from Finder onto the Terminal window. Its location appears after `cd`.
4. Press **Enter**.

On Windows

1. Open the folder in File Explorer.
2. Click the address bar at the top, type `powershell` and press **Enter**. A PowerShell window opens, already in that folder.

A screenshot of a macOS Terminal window. The title bar shows three colored window control buttons (red, yellow, green) and the word "Terminal". The terminal content shows a user at a shell prompt (\$) typing the command `cd /Users/you/Downloads/salesforce-ab-belleza-integral-main`. After pressing Enter, the prompt changes to `$` and the user types `ls`. Pressing Enter again displays a list of files and folders: `LICENSE`, `README.md`, `force-app`, `jest.config.js`, `package.json`, `scripts`, and `sfdx-project.json`.

```
$ cd /Users/you/Downloads/salesforce-ab-belleza-integral-main
$ ls
LICENSE      README.md    force-app    jest.config.js
package.json  scripts      sfdx-project.json
```

Optional check: type `ls` (Mac) or `dir` (Windows) and press Enter. If you see `force-app` in the list, you're in the right place.

4 Connect your org

This tells the CLI which org to install into. You only do it once.

First, get your login details

Developer Edition org: use the username and password you chose when you signed up. Your username looks like an email address, but it isn't always your real email.

Trailhead Playground: Playgrounds don't show you a password, so you need to get one:

1. Open your Playground from Trailhead (**Launch** on any hands-on challenge).
2. Click the **App Launcher** (the 9-dot grid, top left), search for **Playground Starter** and open it.
3. Open the **Get Your Login Credentials** tab. Copy your **username**, then click **Reset My Password** and set a password from the email you receive.

Then connect

In your terminal (still in the app's folder), type:

```
TYPE sf org login web --alias salon0rg
```

1. Your browser opens a Salesforce login page. Log in with the username and password from above.
2. If Salesforce asks you to **Allow** access, click **Allow**.
3. Go back to the terminal. You'll see a success message:

What is --alias salon0rg ?

It's a nickname for your org, so you don't have to type the long username in every command. The rest of this guide uses `salon0rg`.

5 Deploy the app

This sends every part of the app to your org: objects, pages, components, automation and tests.
Type:

```
TYPE sf project deploy start --source-dir force-app --target-org salonOrg
```

Wait about 30 seconds to a minute. When it finishes, you'll see **Status: Succeeded** followed by a long list of the 89 parts that were created:

```
Terminal
$ sf project deploy start --source-dir force-app --target-org salonOrg

----- Deploying Metadata -----

✓ Preparing 268ms
✓ Waiting for the org to respond 1.38s
✓ Deploying Metadata 18.12s
  ▶ Components: 89/89 (100%)
✓ Done 0ms

Status: Succeeded
Target Org: you@yourplayground.com

Deployed Source
State  Name                                Type
Created SalonController                ApexClass
Created AB_Belleza_Integral            CustomApplication
Created Cita_Crear_Transaccion         Flow
... (89 components in total)
```

If you see *Failed* instead, check the Troubleshooting page at the end of this guide.

6 Give yourself access

Salesforce hides new apps until a user is given permission. The app includes a **permission set** (a bundle of permissions) called `AB_Belleza_Integral`. Assign it to yourself:

```
TYPE sf org assign permset --name AB_Belleza_Integral --target-org salonOrg
```

```
Terminal
$ sf org assign permset --name AB_Belleza_Integral --target-org salonOrg
Permsets Assigned
Username                                Permission Set Assignment
you@yourplayground.com                 AB_Belleza_Integral
```

This gives you the app, its tabs, and access to all its records and fields.

7 Load sample data OPTIONAL

An empty app is hard to explore. This step fills it with **fictional** data so every screen has something to show: 12 clients, about 100 appointments over the past months and the next few weeks, services, products (some with low stock), expenses and sales.

```
TYPE sf apex run --file scripts/apex/seed-sample-data.apex --target-org salonOrg
```

```
Terminal

$ sf apex run --file scripts/apex/seed-sample-data.apex --target-org salonOrg
Compiled successfully.
Executed successfully.

""
USER_DEBUG|[144]|DEBUG|Datos de ejemplo cargados: 12 clientes, 99 citas, ...
```

After *Executed successfully* the terminal prints a long technical log. You can ignore it. The line near the end, "*Datos de ejemplo cargados*", means "sample data loaded". Your numbers may differ slightly, because the dates are relative to today.

Built-in safety check

The script only runs in an org with **no clients yet**. If you run it twice, or in an org that already has data, it stops and changes nothing:

```
Terminal

Error (executeRuntimeFailure): Execution failed at this code:
SeedSafetyException: Esta org ya tiene 12 clientes: los datos de ejemplo solo
se cargan en una org vacía de prueba. No se modificó nada.
```

In English: "This org already has 12 clients. The sample data is only loaded into an empty test org. Nothing was changed."

8 Open the app

```
TYPE sf org open --target-org salonOrg
```

Your org opens in the browser, already logged in. Then:

1. Click the **App Launcher** (the 9-dot grid, top left).
2. Type **AB Belleza** in the search box.
3. Under **Apps**, click **AB Belleza Integral**.
4. Click the **AB Belleza Integral** tab, the first one in the navigation bar, to see the dashboard shown on the cover.

Don't see the app? Refresh the page once. More help is on the Troubleshooting page.

Things to try

WHERE	WHAT TO TRY
Dashboard (first tab)	Click <i>+ Nueva cita</i> and book an appointment. Change an appointment's status from its ▼ menu. Click the KPI tiles.
Double-booking check	Book a new appointment at the <i>exact</i> date and time of an existing one. The wizard stops and explains why.
Historial tab	Filter by status and period, search for a client, and click a row to edit it.
Cientes tab	Open a client to see her client file: contact buttons, health notes, visit stats.
Productos tab	Open a product and upload a photo.

+ Run the tests OPTIONAL

Want to confirm everything works in your org? The app includes automated Apex tests. This takes a minute or two:

```
TYPE sf apex run test --class-names SalonControllerTest --class-names  
SalonAutomationTest --code-coverage --result-format human --target-org  
salonOrg
```

Look for **Outcome: Passed** and **Pass Rate: 100%** in the summary at the end.

Troubleshooting

YOU SEE...	WHAT TO DO
<code>command not found: sf</code> or <i>'sf' is not recognized</i>	The CLI isn't installed yet, or the terminal was open during the install. Close the terminal, open a new one and try again. If it still fails, reinstall (step 1).
<i>No authorization information found for salonOrg</i>	The org isn't connected yet, or the alias is spelled differently. Repeat step 4 and use exactly <code>--alias salonOrg</code> .
<i>This directory does not contain a valid Salesforce DX project</i>	The terminal isn't in the app's folder. Repeat step 3 and make sure you can see <code>force-app</code> in that folder.
The browser login in step 4 says your password is wrong	For a Playground, reset the password from <i>Playground Starter</i> (step 4). Check that you're using the username , not your email address.
Step 5 says <i>Failed</i>	Read the error lines in the table it prints. The most common cause is installing into an org that already has a different app with the same object names. Use a fresh Playground.
<i>Duplicate PermissionSetAssignment</i> in step 6	Nothing to fix: the permission set is already assigned to you.
<i>SeedSafetyException</i> in step 7	Expected if the org already has clients. The sample data only loads into an empty org, and nothing was changed.
The app isn't in the App Launcher	Refresh the page. Salesforce sometimes takes a moment to show a newly assigned app. If it's still missing, repeat step 6.
The app opens on a tab other than the dashboard	Salesforce reopens the last tab you visited. Click AB Belleza Integral , the first tab, and it will open there next time.

Words used in this guide

Org	Your own Salesforce environment, with its own data, users and apps.
Trailhead Playground	A free practice org that Trailhead creates for you.
Salesforce CLI	The official command-line tool for working with orgs. <code>sf</code> is its command.
Terminal	The window where you type commands: <i>Terminal</i> on Mac, <i>PowerShell</i> on Windows.
Deploy	To send the app's files from your computer to your org.
Permission set	A bundle of permissions you assign to a user to give access to an app.
Alias	A short nickname for an org, used in commands instead of its username.

That's it

You now have a complete salon management app running in your own org. To learn how it's built (its components, automation and design decisions), read the **README** on GitHub.
